	Core Areas Asset Description											
	Bike Lanes and Bike Sharing	Establish a network of bike lanes and sharing stations. Low-cost and eco-friendly, these lanes boost public transport and air quality but generate modest economic returns.										
	Electric Bus Fleet	Add an electric bus fleet to your city! These buses improve transport efficiency and air quality while reducing energy consumption, offering a decent economic boost.										
	Metro System	Build a metro system for fast, efficient mass transit! It's costly but boosts public transport and air quality. Requires careful placement to avoid overuse of energy and land.										
	Affordable Housing Units	Provide basic, affordable housing to your citizens. It helps house more people but doesn't generate economic profit and may require additional energy and upkeep.										
	Eco-Friendly Apartments	Construct eco-friendly apartments that reduce energy consumption and improve air quality. While expensive and not profitable, they're essential for sustainable housing solutions.										
	Co-Living Communities	Build co-living communities that maximize resource sharing and space. These communities support sustainability but require maintenance and don't generate profit.										
	Urban Parks	Create urban parks that enhance your city's livability, increase air quality, and boost happiness. Affordable and beneficial, parks generate moderate economic growth.										
	Rooftop Gardens	Turn unused rooftops into green spaces. Rooftop gardens improve air quality and lower energy consumption, offering a modest economic boost.										
	Community Gardens	Develop community gardens to engage citizens in sustainable farming. These gardens improve green space and housing quality while offering small economic gains.										
	Recycling Centers	Set up recycling centers to manage waste and generate economic value through resource recovery. Recycling centers provide a significant boost to air quality and job creation.										
	Waste-to-Energy Plants	Transform waste into usable energy! These plants generate energy while reducing landfill use but may lower air quality slightly. A powerful economic generator.										
	Composting Facilities	Convert organic waste into compost for green spaces. Composting facilities improve waste management and air quality while offering a moderate economic return.										
	Solar Farms	Build solar farms to harness clean energy. They reduce emissions and contribute significantly to the city's sustainability, but come with a high initial cost.										
	Wind Turbines	Install wind turbines to generate renewable energy. Wind turbines provide long-term energy solutions and boost air quality, though they require large upfront investments.										
	Energy-Efficient Buildings	Construct energy-efficient buildings that lower energy consumption and improve air quality. These buildings are costly but reduce operational costs in the long run.
